

Annuities Galore on the HP-12C

Tony Hutchins, #1049

Example 1: $10 \boxed{n} 5 \boxed{i} \boxed{R/S} \rightarrow 7.722$. $\boxed{RCL} 1 \rightarrow 39.374 \dots \boxed{RCL} 5 \rightarrow 169.396$, six annuities in all. For $j=0$ to 3, R_j values the sequence t^j at time t , where $t=1$ to n . R_4 values $(n-t+1)$ and R_5 $t^*(n-t+1)$. See below for more detail.

Keystrokes	Display	Keystrokes	Display	Keystrokes	Display
$\boxed{f} \boxed{P/R}$		$\boxed{+}$	32 - 40	$\boxed{RCL} \boxed{n}$	65 - 45 11

\boxed{ENTER}	23 - 36	$\boxed{RCL} \boxed{n}$	56 - 45 11	\boxed{X}	89 - 20
$\boxed{+}$	24 - 40	$\boxed{g} \boxed{LSTx}$	57 - 43 36	$\boxed{STO} 2$	90 - 44 2
$\boxed{STO} 2$	25 - 44 2	$\boxed{y^x}$	58 - 21	$\boxed{-}$	91 - 30
\boxed{CHS}	26 - 16	\boxed{FV}	59 - 15	$\boxed{STO} 5$	92 - 44 5
$\boxed{RCL} \boxed{PMT}$	27 - 45 14	\boxed{PV}	60 - 13	$\boxed{RCL} 0$	93 - 45 0
\boxed{FV}	28 - 15	$\boxed{+}$	61 - 40	$\boxed{g} \boxed{GTO} 00$	94 - 43,33 00
\boxed{PV}	29 - 13	$\boxed{\%T}$	62 - 23	$\boxed{f} \boxed{P/R}$	
$\boxed{RCL} \boxed{n}$	30 - 45 11	$\boxed{STO} 3$	63 - 44 3		
\boxed{X}	31 - 20	$\boxed{g} \boxed{GTO} 93$	64 - 43,33 93		

The formulae are:

Annuity Type	$i > 0, v = 1/(1+i)$	$i = 0$
Level, of 1 in arrears	$R_0 = (1-v^n)/i$	$R_0 = n$
Increasing, of 1, 2, ..., n	$R_1 = ((1+i)R_0 - nv^n)/i$	$R_1 = n(n+1)/2$
Increasing, of 1, 4, ..., n^2	$R_2 = (2(1+i)R_1 - (1+i)R_0 - n^2v^n)/i$	$R_2 = R_1(2n+1)/3$
Increasing, of 1, 8, ..., n^3	$R_3 = (3(1+i)(R_2 - R_1) + (1+i)R_0 - n^3v^n)/i$	$R_3 = R_1^2$
Decreasing, of n, n-1, ..., 1	$R_4 = (n - R_0)/i$	$R_4 = R_1$
Incr./Decr., of n, 2(n-1), ..., n	$R_5 = (n(1+i)R_0 + nv^n - 2R_1)/i$	$R_5 = R_1(n+1) - R_2$

The 12cp needs 8 extra lines. Each of the five \boxed{FV} \boxed{PV} sequences needs to be \boxed{FV} $\boxed{R\downarrow}$ \boxed{PV} \boxed{PV} . *Optionally*, $\boxed{x^2}$ can be used to replace the two \boxed{ENTER} \boxed{X} (lines 41/42 and 67/68). This changes line numbers so the \boxed{GTO} need attending to.

$i\%$ is kept in the upper stack so that the $\text{"}/i\text{"}$ is simply accomplished using $\%T$. For $i > 0$ the order of calculation is R_0, R_4, R_1, R_5, R_2 and R_3 at lines 12, 15, 22, 34, 48 and 63 respectively. For $i = 0$ the order is: R_0, R_1, R_3, R_4, R_2 and R_5 . Next we tabulate the results for: $10 \boxed{n}$ $0 \boxed{i}$ $\boxed{R/S}$ & $10 \boxed{i}$ $\boxed{R/S}$ and calculate durations and demonstrate the little known but provable fact that the true equated time is very close to the arithmetic average of the approximate equated time (D_0) and the duration (D_1).

n=10	R_0	R_1	R_2	R_3	R_4	R_5
$i\% = 0, V_0$	10	55	285	3025	55	220
$D_0 = R_{i+1}/R_i$	5.5	7	7.857	n/a	4	n/a
$i\% = 10, V_1$	6.145	29.036	185.656	1380.636	38.554	133.739
$D_1 = R_{i+1}/R_i$	4.725	6.394	7.437	n/a	3.469	n/a
t_e^*	5.110	6.702	7.652	8.230	3.727	5.222
$(D_0 + D_1)/2$	5.113	6.697	7.647	n/a	3.735	n/a

*Equated time $= t_e = \text{LN}(V_0/V_1)/\text{LN}(1+i)$. $V_1 = V_0(1+i)^{-t_e}$. $V_1 \approx V_0(1+i)^{-D_0}$

Suppose a firm pays every employee reaching 10 years service £1,000, and every year 10 employees do so. A £100,000 fund earning 10% would fund this forever. However the accountant suggests that only a 10 year liability needs be held, as otherwise the firm is reserving for future employees. Using the $R_0 = 6.145$ from above, this would be £61,450. On second thoughts, using accrual accounting only the next year's £10,000 need be reserved in full, as it is fully accrued. We need only reserve for 9/10th of the following £10,000, etc. This is a decreasing annuity, and we can use $R_4 = 38.554$, giving an accrued liability of only £38,554. If the firm decides to inflate the £1,000 by say 3% a year then all we need to do is use an interest rate of about 7%, or more precisely: $10 \boxed{ENTER}$ $3 \boxed{-}$ $1 \boxed{g}$ \boxed{LSTx} $\boxed{\%}$ $\boxed{+}$ $\boxed{\div}$ \rightarrow $6.796 \boxed{i}$ $\boxed{R/S}$ $\rightarrow 7.090$. \boxed{RCL} $4 \rightarrow 42.815$. Hence the accrued liability would increase to £42,815, an increase of 11.052%. The duration from above is $D = 3.469$, so we'd expect a $10\% - 6.796\% = 3.204\%$ reduction in yield to increase the value by $3.469 * 3.204\% = 11.115\%$, surprisingly close for a 3.2% (relatively large) change!
